

Running the Overlay

To start the overlay from fresh, open the file explorer and go to the folder `Dev` under `Local Disk (C:)`. It should be on the sidebar.

Afterwards, select the folder `FixtureDisplay`. This will bring you into the folder in which all of the code belongs.

Configuring the Display

If the league has changed, e.g. you're starting it up for the juniors, you must reconfigure the fixture sources. To do this, double click `settings.py` to run it. In there, by default, you will see a directory for downloads, please leave that for now, and a list of leagues with two boxes, the first, a name for the league, and the second, a link to a spawtz web page.

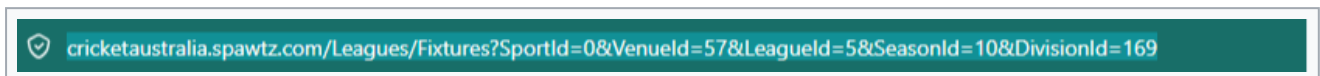

Now, you will need to open your web browser. Go to <https://cricketaustralia.spawtz.com/>, and select `View fixtures and standings`, then select the centre you are at. In our case, that is `Casey`. Next, scroll until you find the leagues you need. In this example, the Open Womens will be used. Across from the league you want to select, click on `Fixtures`. If you want to open multiple, hold `Ctrl` while clicking the link to open them in a new tab.

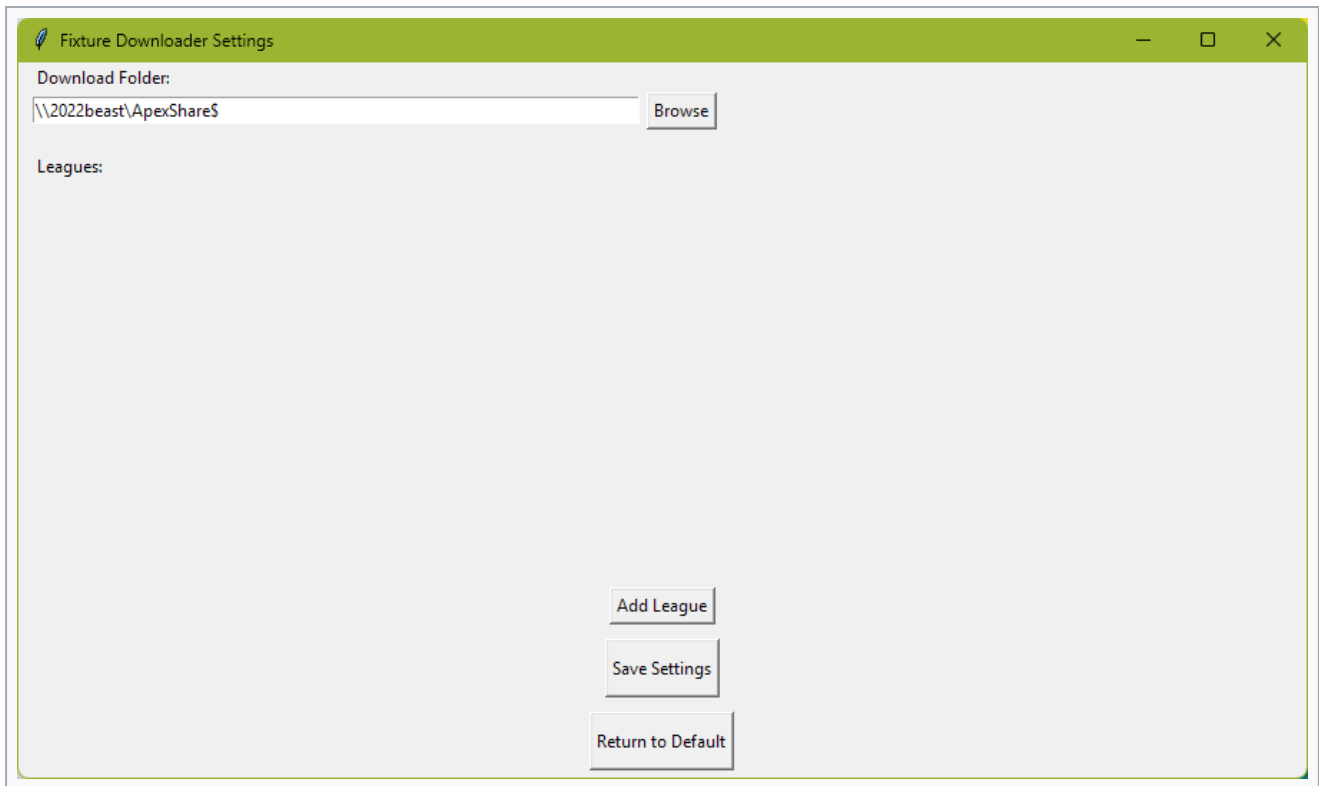

The screenshot shows a web browser window displaying the 'INDOOR CRICKET NATIONAL CHAMPIONSHIPS' page. The page has a dark green header with the title in white. Below the header, there are three tabs: 'OPENS', 'MASTERS', and 'JUNIORS'. The 'OPENS' tab is selected. Underneath, the text reads 'ICNC | Opens - 2026 - Women - Current Fixtures - (Standings)'. The fixtures are organized by date, with yellow headers for 'Wednesday 01 Jul 2026' and 'Thursday 02 Jul 2026'. Each fixture entry includes a time slot, the venue 'Casey', the court number, the teams playing, and a 'vs' separator. The teams are represented by colored links: Vic (blue), Tas (green), SA (red), and Qld (orange).

Wednesday 01 Jul 2026					
1:00PM	Casey	Court 1	Vic	vs	Tas
3:00PM	Casey	Court 4	SA	vs	Qld
Thursday 02 Jul 2026					
9:00AM	Casey	Court 1	Tas	vs	SA
11:00AM	Casey	Court 1	Vic	vs	Qld
3:00PM	Casey	Court 4	Qld	vs	SA
5:00PM	Casey	Court 4	Tas	vs	Vic

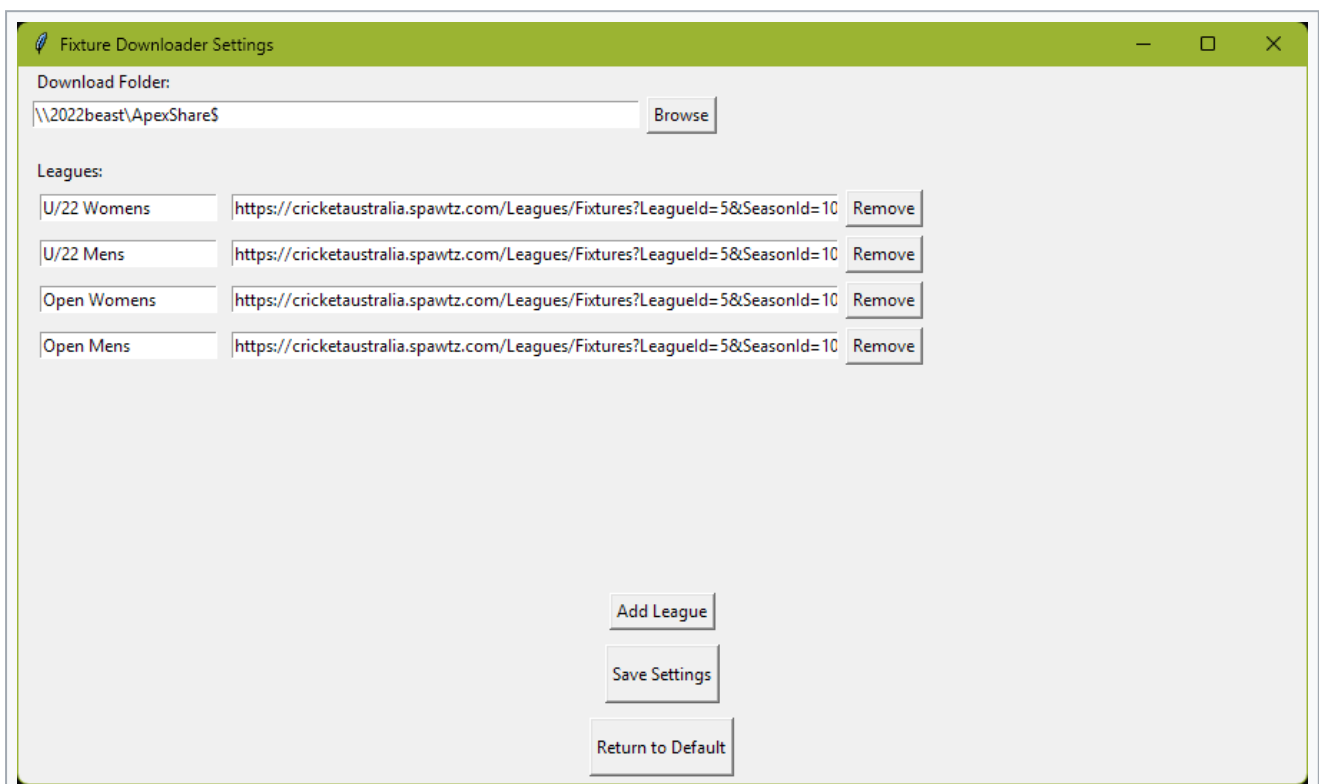

Now that you have the fixtures open, click the link bar. Your browser may look slightly different to mine, but regardless the bar will be in the middle of the top.

It should automatically highlight the entire text in blue, however if it hasn't, press `Ctrl` and `A` at the same time to do so. Now that you have that, press `Ctrl` and `C` at the same time to copy. Now go back to the window of `settings.py` or reopen it if you closed it. Click `remove` on all the leagues you don't need in there until the screen is empty of leagues.

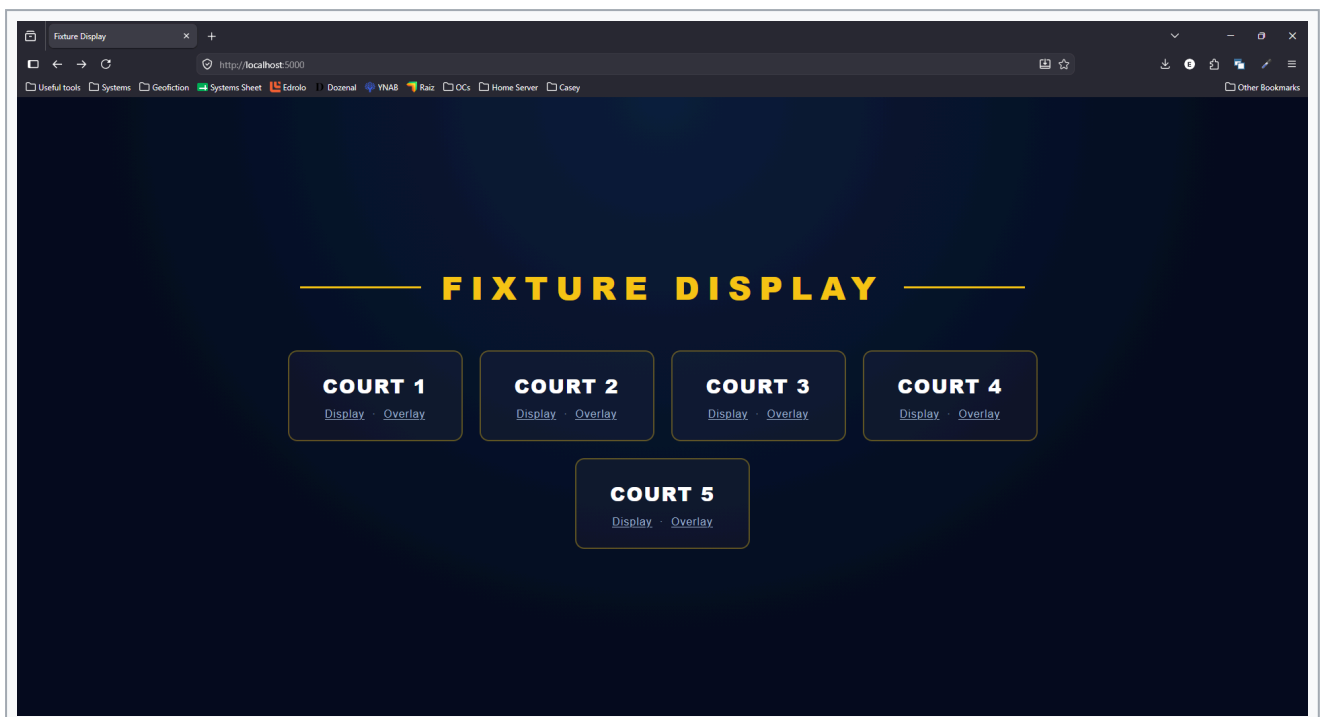

Now, click **Add League**, and enter the details of your league. Select the right bar and press **Ctrl** and **V** at the same time to paste, putting the link in for the page. In the left, put the name of the league in. For my case, it's **Open Womens**, however you may need to put something in like **U/14 Girls**. Repeat that specific process, adding a new league each time until you have the full list of all leagues playing.

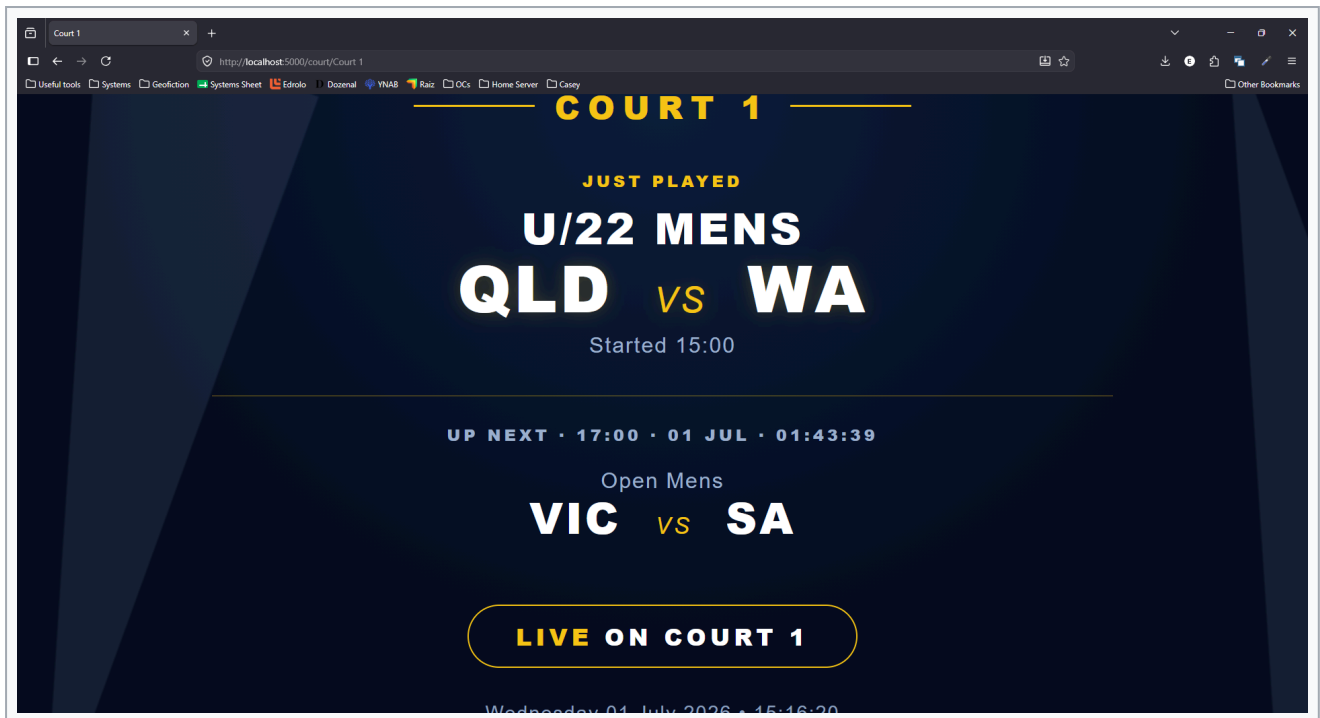

Now that that is done, click `Save Settings` and close the settings by clicking the `X` in the top right of that window.

Starting the Display (The easy way)

Back in the `FixtureDisplay` directory, there should be a file called `Start Display.bat`. Double click this to run it, and click run if it prompts you with a warning. It will open a new terminal window, download the fixtures automatically, before starting the display. Once it gets to the point where it says `Running on all addresses`, the display is up. You can then swap over to a web browser and type in `localhost:5000`, before pressing enter. This will take you to the main page, where you can select the courts you have configured in the last step.

Pick any and pick either court or overlay, and it will take you to a page with a display of the previous and upcoming game. If the timer is ticking, you've done it right. Good job!

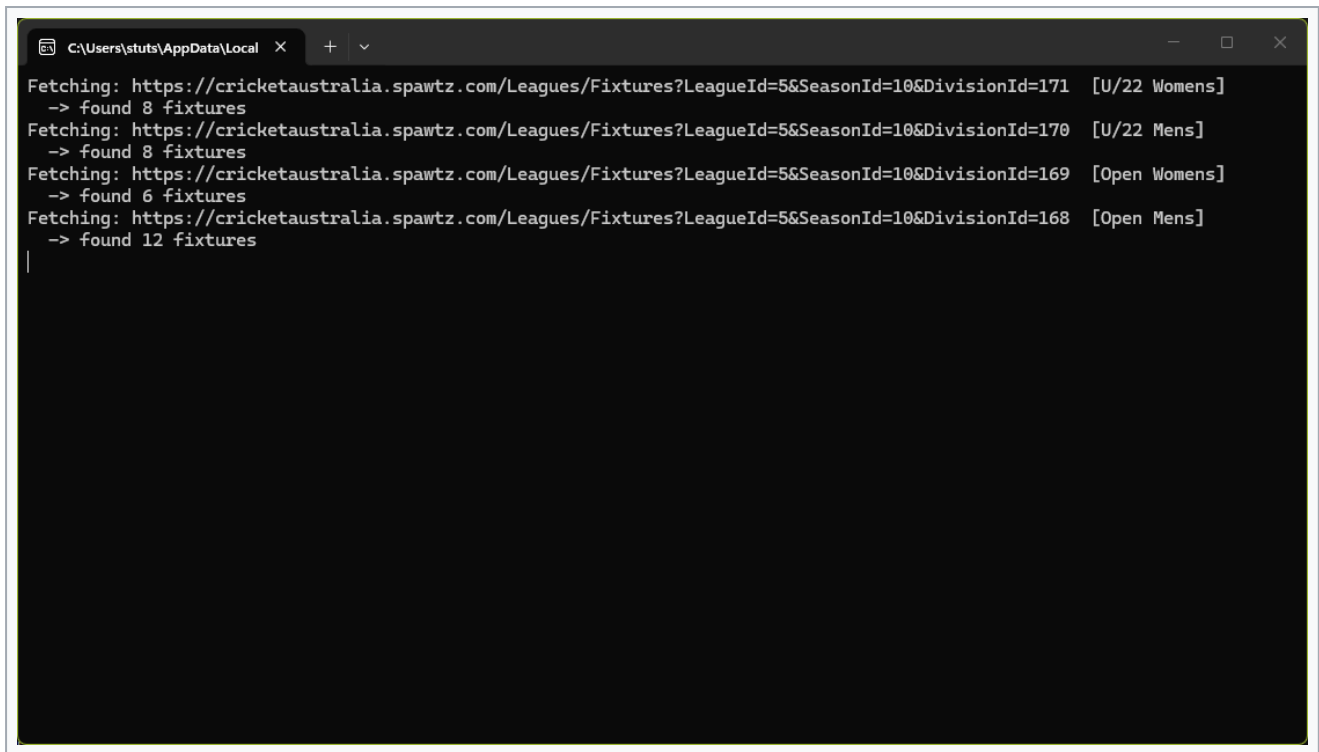

Updating the Fixture

If at any time the fixture has been updated, don't worry, because you can update them while the display is still running, and it will update live. Just follow the next step, [Downloading Fixtures](#), below.

Starting the Display (The hard way)

Downloading Fixtures

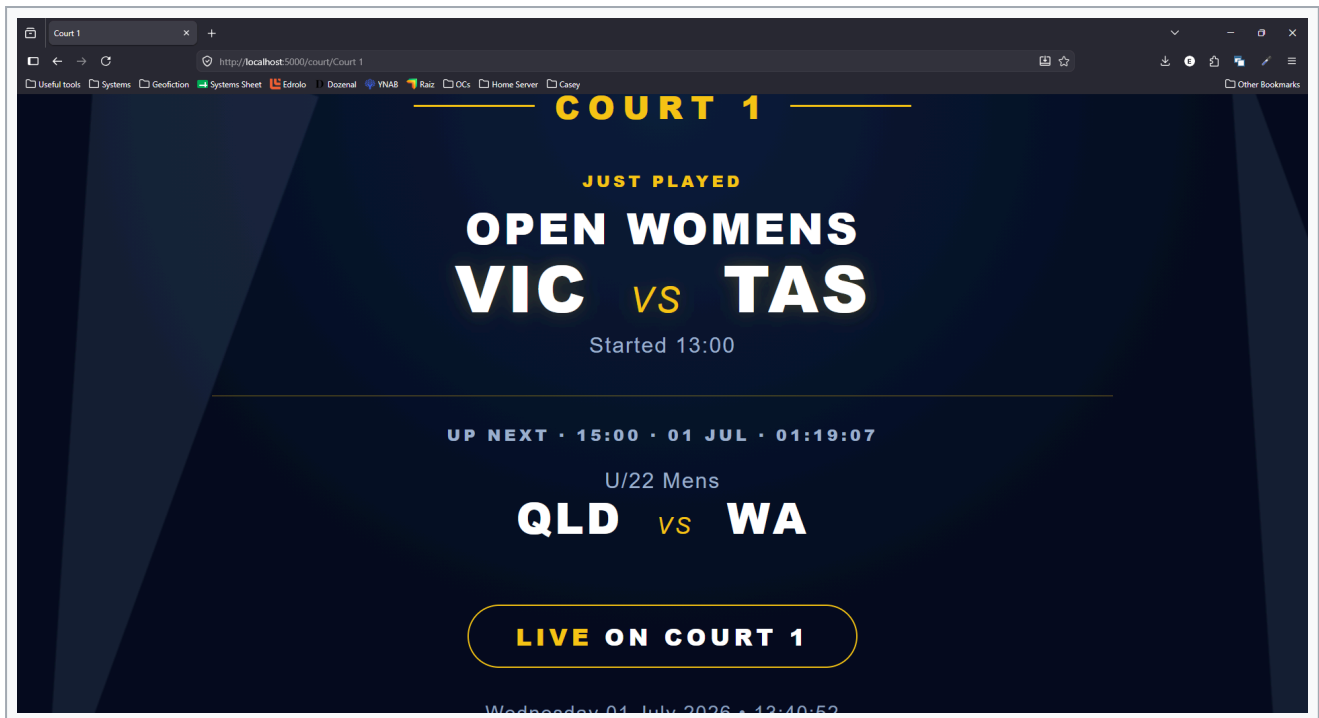

Now, return to your `FixtureDisplay` directory and double-click on `fixture-scraper2.py`. This downloads all the fixtures off of the pages you just put in and formats them in a way the display can read. After the process is complete, the window will close on its own. This should take less than 10 seconds.

```
C:\Users\stuts\AppData\Local  X + v
Fetching: https://cricketaustralia.spawtz.com/Leagues/Fixtures?LeagueId=5&SeasonId=10&DivisionId=171 [U/22 Womens]
-> found 8 fixtures
Fetching: https://cricketaustralia.spawtz.com/Leagues/Fixtures?LeagueId=5&SeasonId=10&DivisionId=170 [U/22 Mens]
-> found 8 fixtures
Fetching: https://cricketaustralia.spawtz.com/Leagues/Fixtures?LeagueId=5&SeasonId=10&DivisionId=169 [Open Womens]
-> found 6 fixtures
Fetching: https://cricketaustralia.spawtz.com/Leagues/Fixtures?LeagueId=5&SeasonId=10&DivisionId=168 [Open Mens]
-> found 12 fixtures
|
```

Running the Display

After that's done, you will need to go back to the `FixtureDisplay` directory and double click on `app.py`. This runs the proper display app and will host it on your local network. Your computer may ask you to allow Python to access apps on the local network. If it does, just click yes, as it allows the computer to host the website. To test, go to a web browser and type into the bar: `localhost:5000/court/Court 1`, and press enter. This should load a page for court 1, and will provide details on the most recent game and the next upcoming game. If you are successful, the screen should look like this:

It's okay if the bottom and top look a little cut-off like they do on this screen, as the page is designed to be viewed in fullscreen. If you see that the timer is counting down for the **UP NEXT** game, then the software is running successfully. Good job! Now all of the other computers on the network should be fine to run it and you can continue going about your day. To view other courts, just change the number after the word **Court** at the end of the address, for example, to 2, 3, 4, or 5.

Troubleshooting

The display is saying **NO MATCH IN PROGRESS** and there are no games scheduled afterward

There are 2 reasons that this may be happening. The first is the simplest. If its on your device, check the address bar, and make sure that the website ends in either **/court/Court 1** or **/overlay/Court 1**. Keep in mind that it is COURT, not COURTS, court singular. I have messed that up quite a few times and been confused when it doesn't connect. Also make sure the the court number is a valid one, for Casey, that's 1 through 5, but for your center, it may be slightly different. If you're sure you have the correct address and the thing still isn't showing up, make sure to check on the **Z:** drive (**ApexShare\$**) that there is a file called **fixtures_combined.csv** and that opening it shows the correct fixtures. If it isn't, reopen the settings app, **settings.py** to make sure that you have entered the links correctly. If you need to, re-copy and re-paste them back in just for good measure.

Can't connect to the website

Firstly, make sure that you have entered **localhost:5000**. This is basically routing the page from going out of your computer onto the network, back into the computer, and is the same

as connecting to the page `127.0.0.1:5000`. If connecting to both `localhost` and `127.0.0.1` both fail, then the program may not be running. Check by looking for a window called `C:\dev\FixtureDisplay\app.py`, which will show that the app is actively running. If it is not, then go through the guide above to restart it. This window must be left open at all times, however it can be minimised by clicking `-` at the top of the window. If you attempt to connect to the website from another device on the network, you will need to know the IP address of the computer you are hosting it on.

On the host computer, press the windows key and type `CMD`. Press enter to open the command prompt. Next, type in `ipconfig` to find your IP address.

```

Command Prompt

```

Under `Wireless LAN adapter Wi-Fi:`, you will find the section labelled `IPv4 Address`, after which will be a 4-section number like the one I have, which has been hidden for my privacy. This is essentially the address the computers on the same network as you use to find your device, and thus shouldn't be shared with anyone on that network with you that you do not trust. On a separate device on the network, you can enter that IP address into a web browser, e.g. `10.70.102.1:5000/court/Court 1`, with `:5000` at the end, being the way the website is hosted. If that doesn't work, it is likely the fact that your device has a firewall enabled, however this is unlikely to be the case. If it is, contact Dave.
